# **OVERVIEW**

The ServSwitch<sup>™</sup> you already own provides multiple ports that can be shared between multiple users. But suppose you need to add more CPUs to your existing ServSwitch, or maybe you want to rackmount the ServSwitch. Take a look at these options to get even more from your ServSwitch.

#### 4-Port Expansion Boards

If you've maxed out your 4-, 8-, or 12-port full-size ServSwitch or ServSwitch Ultra, will you have to buy a whole new switch to add a few more CPUs?

No! We can expand the capacity of your switch, four CPU ports at a time, by installing as many 4-Port Expansion Boards in it as you need—enough for up to 16 CPU ports. Simply call Black Box Tech Support to buy the boards and arrange to ship the switch back to our factory, and we'll put in the boards for you. We might be able to send you a replacement switch that you can temporarily swap in for the one being upgraded, so you don't have any system downtime!

The SW72xA-R5 and KV3108SA-R5 ServSwitch models and KV5100C-R5 expansion board feature audio and serial touch screen support.

NOTE: For ServSwitch Ultra and "new chassis" regular ServSwitch models, we can send you the boards to install yourself, but installing the boards is extremely complex and you can easily damage the switch while doing it. We strongly recommend that you let us install the boards for you.

### **Rackmount Kits**

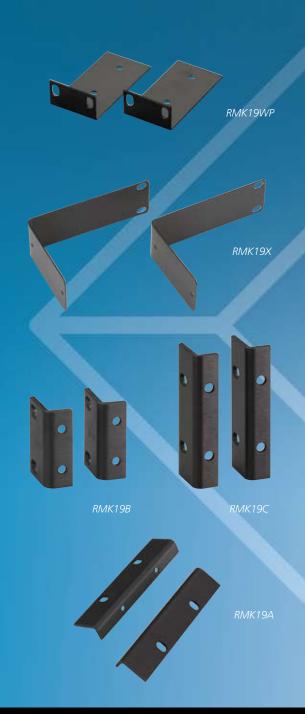

Want to put your ServSwitch KVM switch or extender in a 19" equipment rack? Chances are we have a simple rackmount kit you can install in no time.

Also note that, for some switch models, we also offer rackmount kits for the less common 23" and 24" racks.

### Serial Flash Kit

Flash upgrade the firmware by connecting the ServSwitch KVM switch's RJ-11 serial port to your PC's DB9 serial port using the ServSwitch Serial Flash Kit. It includes an RJ-11 to DB9 adapter and a 10-foot (3-m) RJ-11 (6-wire) straight-through cable.
